

Syllabimagic

Orton-Gillingham Concept: Syllabication

Science: Molecules

Directions:

1. Cut out the word strips from the attached sheets
2. Brush rubber cement on the middle of the strips (between the two syllables).
Let it dry and repeat the process. Sprinkle baby powder or corn starch on the rubber cement.
3. Give each of the students a word strip.
4. Have the students underline the vowel, label the letters ("v" for vowels and "c" for consonants beginning with the first vowel. Divide the word. Mark the vowels and pronounce.
5. Students then fold the strip in half (where the division between the syllables occurs). Have them cut a small slice off the top of the fold.
6. Students unfold the strip and the two pieces remain as one. Have them pronounce the word again (faster).

Ask them why the strip remained as one despite it being cut in half? **Answer:** When the paper was cut, the rubber cement was exposed and the exposed molecules of the rubber cement attached to each other thereby holding the paper together.
